

Together with other European projects (as ANIKETOS and Syssec)

NESSoS organized the session during ICT 2013 on:

Engineering a Secure Cyber Space for Europe by 2020

Our lives in the physical and cyber space depend on secure and trusted

software and systems. This is particularly evident in cyber-physical systems

e.g. cars/avionics. While effort is on-going to develop the engineering of secure

systems on specific aspects such as embedded systems, control systems,

software based services; a holistic effort to secure cyber space as whole

is needed.

The session provides a focus and networking opportunity for potential and

future collaborators to discuss the possibilities for future work and projects.
